

WISER User's Guide

Version 5.0

Wireless Information System for Emergency Responders

The screenshot shows the WISER web application interface. At the top, there is a navigation bar with the NIH logo, 'U.S. National Library of Medicine', and 'Specialized Information Services'. The main header includes 'WebWISER Home', 'Substance List', 'Help Identify', 'Tools', and 'Help'. A 'Current Profile' dropdown menu is set to '1st Responder'. The main content area is divided into several sections: 'Welcome to WebWISER' with a brief description of the system; 'Known Substances' and 'Help Identify Chemical' buttons; 'Tools' for exploring general tools and reference material; 'Other Chemical Emergency Resources at NLM' listing various databases and services; and 'Other Chemical Emergency Resources' listing external organizations like DOT ERG, EPA, and CDC. On the right, there is a 'Symptom Category' dropdown set to 'Respiratory', a list of symptoms with checkboxes, and a 'Selected Symptoms' box. Below this is a map showing a location in a yellow-shaded area. The bottom of the page contains footer information, including PDF document viewing instructions and contact details for the National Library of Medicine.

1. Introduction

The Wireless Information System for Emergency Responders (WISER) is a system concept for providing first responders at the scene of hazardous material incidents – chemical, biological, or radioactive – with integrated information, decision support, and communications. WISER provides critical chemical information quickly and conveniently on mobile devices, such as PDAs, Windows Desktop computers, tablet computers, field laptops, and mobile phones. It aids in the identification of unknown chemicals and, once the chemical is identified, provides guidance on immediate actions necessary to save lives and protect the environment. Substance information and identification properties come from the Hazardous Substances Data Bank (HSDB), developed and maintained by the National Library of Medicine.

WISER currently exists as a standalone application for the Microsoft Windows, iOS, and Android platforms and as a web application; this document describes the web application version of WISER, WebWISER, that is often referred to as simply WISER below. WISER contains HSDB information and decision support logic for 400+ substances (future versions will provide access to more substances). The substances were chosen based on first responder inputs, the degree of chemical hazard, and the historical frequency of incidents. The WISER application assists first responders in rapidly determining the substance involved and gives the first responder critical information regarding the substance, allowing them to take the necessary immediate actions to minimize the effects of the hazmat incident.

1.1. Features

- Access to NLM's Hazardous Substances Data Bank (HSDB) and Chemical Hazards Medical Management (CHEMM) content, which contains a wealth of detailed, peer-reviewed information on hazardous substances
- Comprehensive decision support, including assistance in identification of an unknown chemical or chemical syndrome and guidance on the immediate actions necessary to save lives and protect the environment
- GIS support provides for isolation/protective distance overlays on a map of the incident
- Tools and reference materials, including triage tools, radiological incident support, and WMD response guidelines
- User Profiles enable users to specify the role they are currently playing at the scene of an incident: first responder, HAZMAT specialist, EMS specialist, hospital provider, or preparedness planner. The application interface is customized so that the information most relevant to the respective job can be quickly accessed.
- Biological substance list and substance data
- Radiologicals
 - Radioisotope substance list and substance data
 - Tools and reference documentation for on-scene support of radiological events

1.2. System Requirements

WebWISER requires a computer with access to the internet and is best viewed on the following browsers:

- Google Chrome 30 or greater

- Mozilla Firefox 24 or greater
- Internet Explorer 7.0 or greater
- Safari 5 or greater

1.3. Disclaimer

The U.S. Government does not warrant or assume any legal liability or responsibility for the accuracy, completeness, or usefulness of any information, apparatus, product, or process disclosed.

It is not the intention of NLM to provide specific medical advice to the public, but rather to provide users with information to better understand their health.

NLM does not endorse or recommend any commercial products, process, or services.

2. A Walkthrough of WISER

Welcome to WebWISER

WISER is a system designed to assist emergency responders in hazardous material incidents. WISER provides a wide range of information on hazardous substances, including substance identification support, physical characteristics, human health information, and containment and suppression advice. To get started, configure your profile and select an item below.

Known Substances
Search for a substance within WISER's database of known substances.

Help Identify Chemical
Identify an unknown chemical based on its physical properties, symptoms of exposure, the environment, and other criteria.

Tools
Explore general tools and reference material.

WISER is best viewed with the following browsers (indicated version or higher): Internet Explorer 7, Firefox 24, Safari 5, or Google Chrome 30.

WISER is also available as a stand-alone application for PCs and various mobile platforms, including iOS and Android devices. See the [WISER home page](#) for free downloads and more information about WISER.

WebWISER is accessed by visiting <http://webwiser.nlm.nih.gov> with your browser of choice.

The remainder of this section details the functionality of WISER using a walkthrough of two typical scenarios. The first of these scenarios discusses the use of WISER when dealing with a known substance. This scenario demonstrates how to search for a specific WISER substance, details several options for browsing WISER's set of substances, and explains how to delve into WISER's extensive database of substance information. The second of these scenarios demonstrates the Help Identify Unknown Chemical feature of WISER, a feature that allows the user to identify a chemical substance using its physical properties, symptoms of exposure, the environment, and other criteria.

Look for this symbol  for quick tips that can help you take advantage of advanced WISER features.

2.1. Known Substance

In the known substance scenario, you are the first responder at a scene. There is an overturned cargo tank with the words 'Hydrogen Peroxide' on the side; the papers on board and the driver verify that it is hydrogen peroxide. There is a small fire caused by the engine on the cargo tank. The driver of the truck has been splashed with hydrogen peroxide and may have ingested some of it.

2.1.1. Assess the Scene

Use WISER to assist you with the immediate tasks at hand:

1. Clear out an appropriate area around the tanker truck
2. Treat the driver.
3. Respond to the small fire.

First, select the Search Known Substances button from the WISER home page or Substance List from toolbar.

Search for the substance by name. Enter 'Hydrogen Peroxide' into the Search text field.

Search Known Substances

Search Text

Protective Distance

[Distances per ERG Guide 140](#)
[Distances per ERG Guide 143](#)

The following is extracted from [ERG Guide 140](#): OXIDIZERS

PUBLIC SAFETY

As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 meters (150 feet) for liquids and at least 25 meters (75 feet) for solids.

EVACUATION

Large Spill

Consider initial downwind evacuation for at least 100 meters (330 feet).

Fire

If tank, rail car or tank truck is involved in a fire, ISOLATE for 800 meters (1/2 mile) in all directions; also, consider initial evacuation for 800 meters (1/2 mile) in all directions.

In Canada, an Emergency Response Assistance Plan (ERAP) may be required for this product. Please consult the shipping document and/or the Canada and United States National Response Centers reference document.

[Go to top](#)

The following is extracted from [ERG Guide 143](#): OXIDIZERS (Unstable)

PUBLIC SAFETY

As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 meters (150 feet) for liquids and at least 25 meters (75 feet) for solids.

EVACUATION

Spill

See the [Initial Isolation and Protective Action Distances](#) for highlighted materials. For non-highlighted materials, increase, in the downwind direction, as necessary, the isolation distance shown under "PUBLIC SAFETY".

Fire

If tank, rail car or tank truck is involved in a fire, ISOLATE for 800 meters (1/2 mile) in all directions; also, consider initial evacuation for 800 meters (1/2 mile) in all directions.

In Canada, an Emergency Response Assistance Plan (ERAP) may be required for this product. Please consult the shipping document and/or the Canada and United States National Response Centers reference document.

Hydrogen Peroxide

CAS RN: 7722-84-1

Treatment Overview

0.4.2 ORAL EXPOSURE

- A) MANAGEMENT OF MILD TO MODERATE TOXICITY
 - 1) Treatment is symptomatic and supportive. Water can be administered to dilute the solution in the case of ingestion. Gastric distention may be relieved by insertion of a nasogastric tube and suction. A careful examination should be done to detect any gas formation. Ocular exposure to 3% solution usually requires only thorough irrigation.
- B) MANAGEMENT OF SEVERE TOXICITY
 - 1) Upper airway injury may require intubation. Patients may require resuscitation for burns. Endoscopy should be performed to assess gastrointestinal tract injury if the patient is symptomatic or if higher concentration ingestion is suspected. Obtain surgical consult for patients with evidence of gastrointestinal tract perforation. If the patient has significant symptoms of oxygen embolism (such as CNS effects), place the patient in Trendelenburg position and consider treatment with hyperbaric oxygen. Treat seizures with IV benzodiazepines or barbiturates. Ocular exposure to high concentrations warrants slit lamp examination and ophthalmologic consultation.
- C) DECONTAMINATION
 - 1) PREHOSPITAL: Do not induce vomiting or administer activated charcoal. Irrigate any dermal or ocular exposures with large volumes of water.
 - 2) HOSPITAL: Because hydrogen peroxide causes tissue injury rather than systemic toxicity, there is no role for activated charcoal. Insertion of a nasogastric tube to remove gastric contents and to decompress the stomach may be attempted following large ingestions.
- D) AIRWAY MANAGEMENT
 - 1) Endotracheal intubation should be considered early for patients who have symptoms of upper airway obstruction.
- E) ANTIDOTE
 - ...

Finally, for information on the correct response to the fire, select the Fire Procedures hot link in the data menu, as shown below. (The Fire Procedures is also accessible from the Hazmat submenu).

Hydrogen Peroxide

CAS RN: 7722-84-1

Fire Fighting Procedures

Fires caused by the compound are best controlled by large amounts of water. Chemical extinguishers should be used as they hasten decomposition of the peroxide. Fire fighters should wear goggles and self contained breathing apparatus.

Water for fires resulting from spillage.

If material involved in fire: use water in flooding quantities as fog. Cool all affected containers with flooding quantities of water. Apply water from as far a distance as possible.

Evacuation: If fire becomes uncontrollable - consider evacuation of one-half (1/2) mile radius.

In case of fire, water should be applied by the sprinkler system or by hose from a safe distance, preferably with a fog nozzle. Foam may be necessary instead if the peroxide is diluted in a low density flammable solvent. Portable extinguishers should not be used except for very small fires. Peroxides threatened by fire should be wetted from a safe distance for cooling. /Peroxides, Organic and Inorganic/

Find more information on this substance at: [Hazardous Substances Data Bank](#) , [TOXMAP](#) , [TOXNET](#) , [PubMed](#)

Customize the hot links and content that appear in the substance data menu by selecting your WISER profile.

1st Responder

Select your profile to customize WISER's content to better suit your role in an emergency.

2.1.2. Dive Deeper

The data presented above is only a small sample of the data provided by WISER. Use the data menu to acquire other information as the situation requires. Here is a small sample of the data that is available for a given substance:

- DOT Emergency Guidelines
- WMD Response Guidelines
- NFPA Hazard Classification
- PPE (Personal Protective Equipment & Clothing)
- Synonyms
- Reactivities & Incompatibilities
- AEGL (Acute Exposure Guideline Levels)
- NIOSH Recommended Exposure Levels
- OSHA Standards
- Environmental Fate
- Non-Human Toxicity Values
- Imagery (biological substances)
- And much, much more

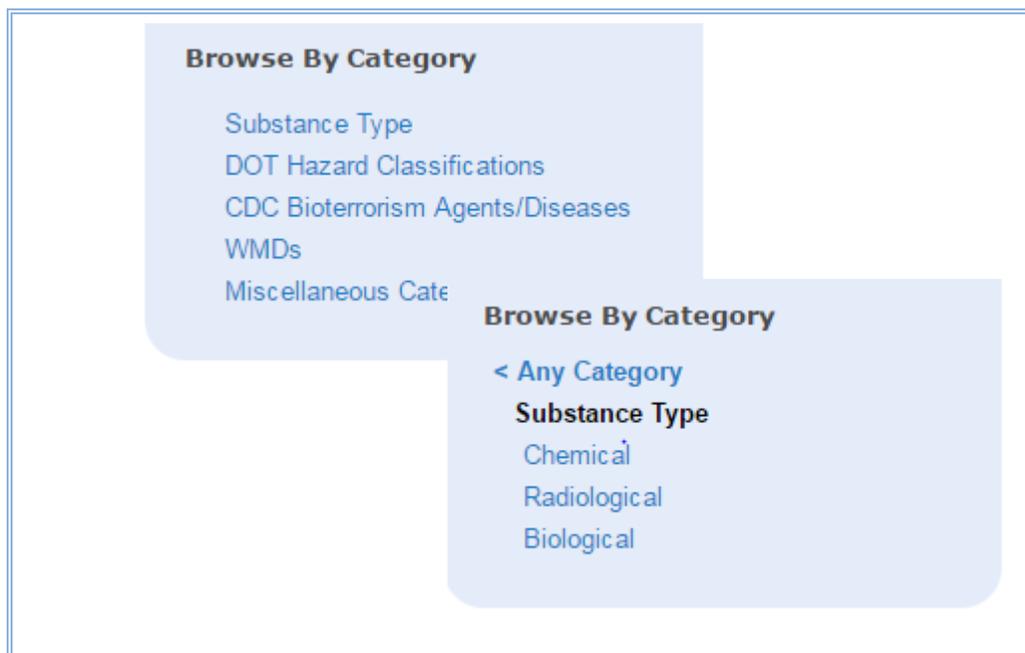

Additional resources from the National Library of Medicine are available at by simply selecting the online resource of interest.

Find more information on this substance at: [Hazardous Substances Data Bank](#) , [TOXMAP](#) , [TOXNET](#) , [PubMed](#)

WISER substances are categorized. Use the Browse By Category section to filter substances (e.g. all biological substances).

2.1.3. Map the Protective Distance

Protective distance data represents the areas likely to be affected during the first 30 minutes after substances are spilled, per the DOT Emergency Response Guidebook. In addition to viewing the raw distance data for a substance, these distances can be visualized on a live map. This feature leverages Microsoft's Bing™ mapping technology.

Open Protective Distance from the Hazmat data menu item and then choose the map tab found below the substance name.

A generic map with no specific location will be displayed. Using an address or specific longitude and latitude, enter a specific spill location.

A full or partial address can be provided. The following addresses are valid examples:

- 9999 Main street, Silver Spring, Maryland
- Main St., Silver Spring, MD
- Silver Spring, MD
- 21023 (a zip code)

If an invalid address is entered, Bing™ will often display a list of suggestions.

Adjust the parameters of the spill as needed. These parameters include:

- Wind direction (Note that you must point the arrow into wind.)
- Spill size

- Time of day
- Location of spill (for water reactive substances)
- Container Type (for a limited number of substances)
- Wind Speed Type (for a limited number of substances)

2.2. Unknown Chemical

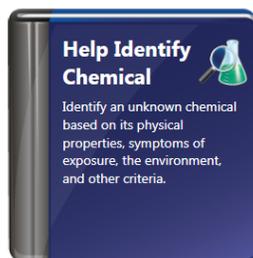

Note: *This feature only supports identification of chemicals. The substances in WISER's radioisotope and biological substance lists are excluded.*

Note: *The tutorial section contains references to substance counts which may change as updated versions of the WISER database are released. This would be caused by the addition of new substances or updates to the search data. The counts reflected in these sections should be used for example purposes only.*

In this scenario, you are the hazardous materials specialist responding to an incident at a warehouse. The warehouse has been cleared and the situation has been stabilized. Your primary task is to identify the substance and provide information and recommendations to the incident commander.

The substance in question has been leaking from an unmarked barrel. It has been described as a colorless liquid with an alcohol smell. The workers from the warehouse are showing the following symptoms: nausea, dizziness, headache, eye irritation, and low body temperature.

First, select the Help Identify Unknown Chemical button from the WISER home page or Help Identify from the toolbar.

The initial, or start, help identify page presents the various help identify search criteria available to a first responder as tabs found along the left side of the window.

- Properties: for designating the physical properties of the substance, such as state
- Symptoms: for designating signs/symptoms of victims due to exposure to the substance
- Categories: for classifying a substance by categories, such as “flammable”, “meth lab”, etc.
- NFPA 704: for entering hazard values from a full or partial NFPA 704 placard
- Transport: for indicating the DOT placard found on the transport container, and/or the type of rail car or road trailer used to transport the substance

Results link is used to browse your results, discussed later in this section with the ability to search within them. The Start Over option will return you to this initial screen.

Help Identify Unknown

Using the options on the left, identify an unknown **chemical** by selecting criteria from for any combination of the following:

- Physical properties of the substance
- Signs/symptoms from exposure to the substance
- NFPA 704 full or partial placard values
- Substance categories (flammable, meth lab, etc.)
- Transport identification: DOT placard and/or type of rail car or road trailer

Counts displayed after the criteria options indicate the size of the results list if that option is selected.

Substances not matching ALL selections are eliminated; click **Results** to see a list of the remaining substances.

Click **Start Over** to clear all selections.

Results Count 438 of 438

The Help Identify Unknown Chemical tool presents these options without prompt. Select the criteria appropriate to the current scene and enter the information you know or witness.

In the scene described above, a colorless liquid with an alcohol smell has been discovered. These properties of the unknown chemical can be added as criteria to the search. Select Properties from the menu on the left and select the State button, bringing up the possible values of physical state. Select 'liquid' and add it the selected properties using the Add button. The current search results will be reduced to match this newly selected criteria.

---	------	---------------------------------------

Results Count 12 of 438

Based on the results of the grouping, the user tests the substance and observes that it is not soluble and floats on water. Thus, the “sinks in water” substances can be removed. This is done by clicking the appropriate remove button. This will remove this substance from the current search. Note that the Show Removed Items checkbox may be selected to display these now removed items and, if desired, include these substances in the current search.

The remaining substances must be examined in more detail to determine the correct substance. For example, select Sulfur Trioxide to view its substance data. The Key Info indicates that it is water-reactive. Further investigation and expert analysis on the scene makes it likely that this substance can be removed. Remove this substance from the list by selecting the remove button.

 Pinacolyl Alcohol	Name	<input type="button" value="remove"/>

Results Count

The final results of the search are 1-Hexanol, Isopropanol, n-Butyl Alcohol and Pinacolyl Alcohol. Further investigation of each, shows that these hydrocarbons have very similar characteristics and procedures. For example, the Emergency Response Guidelines for three of them are the same.

CHEMM-IST, the CHEMM Intelligent Syndrome Tool, is a new help identify tool that can be used as an aid for identifying the chemical a patient was exposed to in a mass casualty incident. To use CHEMM-IST, simply provide answers to the questions as they are provided. The Syndrome Prediction display will update as more information is provided and the result becomes more certain.

The example below shows the case of Pesticide syndrome. Organic phosphorus pesticides, carbamate pesticides, and the organophosphorus "nerve agents" (e.g., sarin, soman, tabun, and VX) all inhibit acetylcholinesterase, resulting in cholinergic overstimulation. Common signs and symptoms include pinpoint pupils, eye pain, shortness of breath, wheezes, rales, sweating skin, drooling, tearing, vomiting, diarrhea, fasciculation, coma, and seizures. Fill in this information as the pertinent questions are asked. The results in the screenshot below show a high likelihood of an encounter with pesticide syndrome. Select the Pesticide Syndrome link for more information about this syndrome.

■ Uncertain ■ More Probable ■ Most Probable

Assumptions

- The scene is suspicious and/or a reasonably foreseeable setting for a chemical exposure.
- This assumes that an inhalation exposure has occurred and the chemical has not deposited on the skin.
- The focus is on the patient's response.

Clicking on any question (hyperlinked) above in Progress will allow you to go back to the question to select a different answer. The subsequent answers will be erased.

3. Appendix

3.1. Tools

WISER includes a set of utilities and reference materials along with the Known Substance and Help Identify Unknown Chemical functionality discussed above. Access tools using a button on the WISER home page or via the top menu.

Tools fall into one of three categories, outlined below.

- General utilities with their own unique content and functionality.
- Algorithms – these are presented in an “algorithm viewer” which allows the user to respond to questions and walk through a path of an algorithm or flow chart in a “wizard-like” fashion.
- Reference Materials – these are instances of reference documentation, and are presented in a reference material viewer that provides for the browsing of all reference materials.

3.1.1. General Tools / Utilities

Many tools simply provide a specific piece of functionality that compliments existing WISER features. These tools, such as Radiation Unit Converter shown below, provide a specific functionality for a specific task.

Radiation Unit Converter

Conversion Type

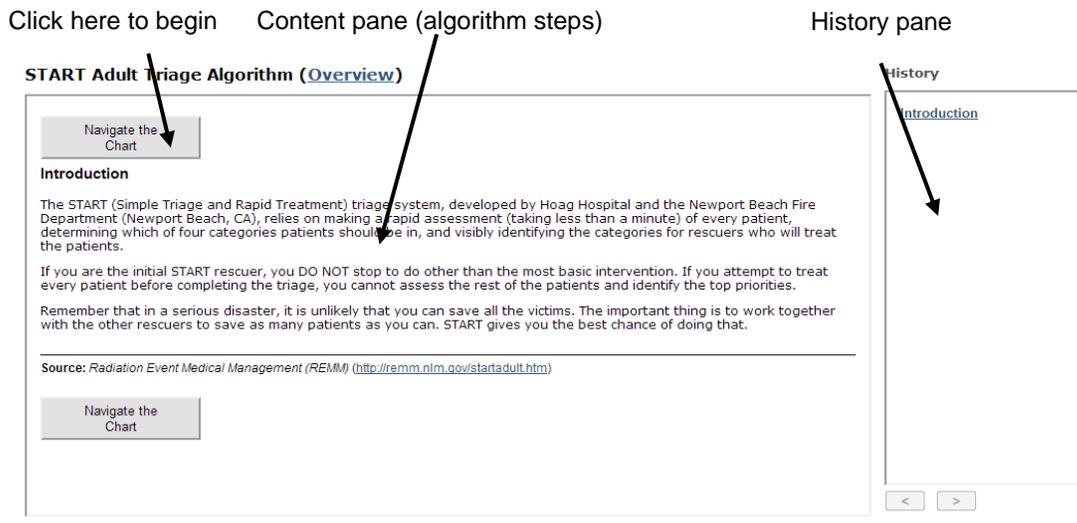

From

Unit	Abbrev	Value
millicurie	mCi	1,000
microcurie	μCi	1,000,000
nanocurie	nCi	1,000,000,000
pilocurie	pCi	1.00e+012
becquerel	Bq	3.70e+010
terabecquerel	TBq	0.037
gigabecquerel	GBq	37
megabecquerel	MBq	37,000
kilobecquerel	kBq	37,000,000

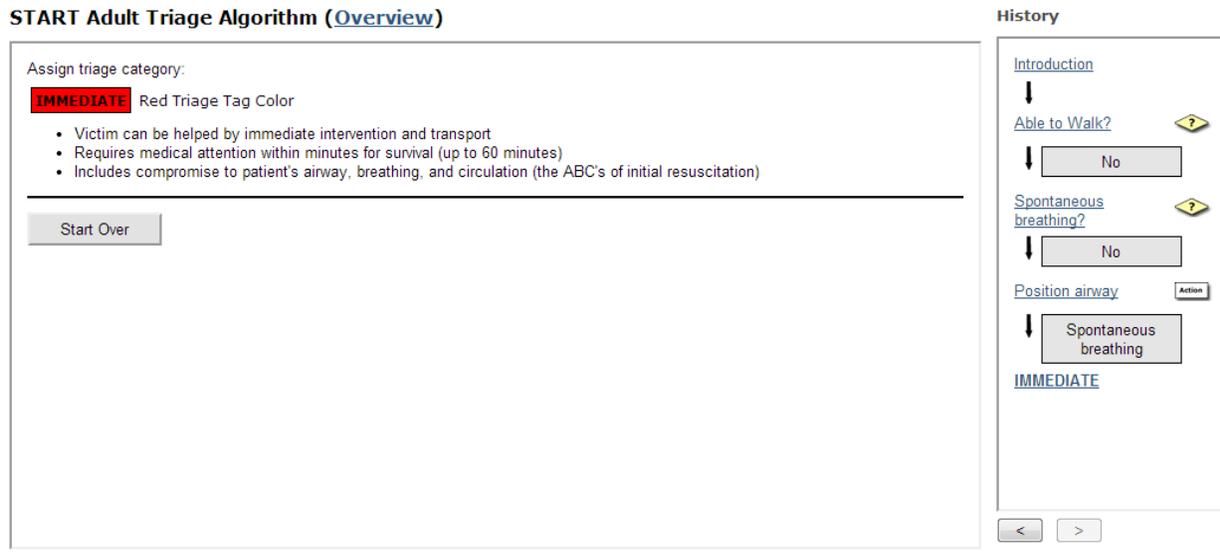

3.1.2. Algorithms

An algorithm viewer is available for helping the user walk through processes that involve multiple steps and decision points, often presented as a “flow chart”. In the WISER Toolbox, these tools are displayed with a flow chart symbol next to them: . Examples include the START and JumpSTART triage algorithms.

The initial display for an algorithm consists of an introduction, a button to begin navigation of the algorithm, and an Overview that previews the entire algorithm. Press the navigate button, and respond to the questions presented until an endpoint is reached (the content pane will not contain any responses to select).

The left and right arrow keys at the bottom of the history pane provide for backing up and going forward through the steps already visited. To quickly return to a specific step, click that step in the list displayed in the history pane. Upon returning to a previous step, a different response can be chosen, and navigation resumes at that point of the algorithm. Boldface is used in the history pane to highlight the step that is currently being viewed in the left content pane.

3.1.3. Reference Materials

Reference material options in the toolbox are displayed with a small note next to them.

Selecting any of these opens a reference material viewer with two panes:

- The right pane displays the selected content.

- The left pane contains a “tree” representing the table of contents of all reference materials for a particular grouping, for example, all radiological reference materials. This tree can be used to navigate to and display the other documents included within the current material subject.

In the table of contents, individual documents can be selected within the table of contents to view their content in the right pane. In addition, documents grouping will concatenate all of their containing children.

A toolbar along the top of the reference material viewer allows for navigation back and forth through the history of previously viewed documents, as well as a print button that will print the contents of the right pane.

Chemical Medical Management Information

Acute Patient Care Guidelines

▼ **Procedures**

- ▶ First Responder
- ▶ Hospital Provider
- ▶ Preparedness Planner
- ▶ Types of Emergencies
- ▶ Initial Event Activities
- ▶ Patient Management
- ▶ Medical Treatment Modifiers
- ▶ Tools, Guidelines, and Planning
- ▶ References, Data Center

On-site Activities

- [Major Goals of the Initial Response](#)
- [Protective Actions](#)
- Specific Types of Emergencies
 - [Discovering an Event](#)
 - [Public Incident](#)
 - [Terrorist Incident](#)
 - [Transportation Accident](#)
 - [Industrial Accident](#)
- See also: [Personal Protective Equipment \(PPE\) Guidance](#)
- See also: [Triage Guidelines](#)
- See also: [Decontamination Procedures](#)

Major Goals of the Initial Response

1. [Notify local authorities](#)
2. **Establish local on-site [Incident Command System](#) (OSHA)**
 - [FEMA Hazardous Material Incident Guidelines](#) (DHS/FEMA)
3. **Establish Control Zones:**
 - [Estimation of protective distance/threat zone](#)
 - **Hotzone/perimeter security**
 - Rescuers should be trained and appropriately attired before entering the Hotzone. If the proper equipment is not available, or if rescuers have not been trained in its use, call for assistance from a local or regional HAZMAT team or other properly equipped response organization.
 - Rescuer Protection - When a chemical is unidentified, worst-case possibilities concerning toxicity must be assumed. The potential for severe local effects (e.g., irritation and burning) and severe systemic effects (e.g., organ damage) should be assumed when specific rescuer-protection equipment is selected.
 - Respiratory Protection: Pressure-demand, self-contained breathing apparatus

4. About NLM

The National Library of Medicine (NLM) is the world's largest medical library. The Specialized Information Services (SIS) Division of NLM is responsible for information coverage and services for several areas, including environmental health and toxicology, AIDS, and directories to other information resources concerned with health and biomedicine. SIS maintains the Hazardous Substance Data Bank (HSDB), covering over 4700 substances, their toxicology, emergency handling procedures, and environmental fate. The NLM is part of the National Institutes of Health, an agency of the U.S. Department of Health and Human Services.
